

## 5.223 `lex_between`

	DESCRIPTION	LINKS	AUTOMATON
Origin	[95]		
Constraint	<code>lex_between(LOWER_BOUND, VECTOR, UPPER_BOUND)</code>		
Synonym	<code>between.</code>		
Arguments	LOWER_BOUND : <code>collection(var-int)</code> VECTOR : <code>collection(var-dvar)</code> UPPER_BOUND : <code>collection(var-int)</code>		
Restrictions	<code>required(LOWER_BOUND, var)</code> <code>required(VECTOR, var)</code> <code>required(UPPER_BOUND, var)</code> <code> LOWER_BOUND  =  VECTOR </code> <code> UPPER_BOUND  =  VECTOR </code> <code>lex_lesseq(LOWER_BOUND, VECTOR)</code> <code>lex_lesseq(VECTOR, UPPER_BOUND)</code>		
Purpose	The vector <code>VECTOR</code> is lexicographically greater than or equal to the fixed vector <code>LOWER_BOUND</code> and lexicographically smaller than or equal to the fixed vector <code>UPPER_BOUND</code> .		
Example	$(\langle 5, 2, 3, 9 \rangle, \langle 5, 2, 6, 2 \rangle, \langle 5, 2, 6, 3 \rangle)$		
	The <code>lex_between</code> constraint holds since: <ul style="list-style-type: none"> <li>The vector <code>VECTOR</code> = <math>\langle 5, 2, 6, 2 \rangle</math> is greater than or equal to the vector <code>LOWER_BOUND</code> = <math>\langle 5, 2, 3, 9 \rangle</math>.</li> <li>The vector <code>VECTOR</code> = <math>\langle 5, 2, 6, 2 \rangle</math> is less than or equal to the vector <code>UPPER_BOUND</code> = <math>\langle 5, 2, 6, 3 \rangle</math>.</li> </ul>		
Typical	<code> LOWER_BOUND  &gt; 1</code> <code>lex_lesseq(LOWER_BOUND, UPPER_BOUND)</code>		
Symmetries	<ul style="list-style-type: none"> <li><code>LOWER_BOUND.var</code> can be <a href="#">decreased</a>.</li> <li><code>UPPER_BOUND.var</code> can be <a href="#">increased</a>.</li> </ul>		
Arg. properties	<a href="#">Suffix-contractible</a> wrt. <code>LOWER_BOUND</code> , <code>VECTOR</code> and <code>UPPER_BOUND</code> ( <i>remove items from same position</i> ).		

<b>Usage</b>	This constraint does usually not occur explicitly in practice. However it shows up indirectly in the context of the <code>lex_chain_less</code> and the <code>lex_chain_lesseq</code> constraints: in order to have a complete filtering algorithm for the <code>lex_chain_less</code> and the <code>lex_chain_lesseq</code> constraints one has to come up with a complete filtering algorithm for the <code>lex_between</code> constraint. The reason is that the <code>lex_chain_less</code> as well as the <code>lex_chain_lesseq</code> constraints both compute feasible lower and upper bounds for each vector they mention. Therefore one ends up with a <code>lex_between</code> constraint for each vector of the <code>lex_chain_less</code> and <code>lex_chain_lesseq</code> constraints.
<b>Algorithm</b>	[95].
<b>Reformulation</b>	The <code>lex_between(LOWER_BOUND, VECTORS, UPPER_BOUND)</code> constraint can be expressed as the conjunction <code>lex_lesseq(LOWER_BOUND, VECTORS) ∧ lex_lesseq(VECTORS, UPPER_BOUND)</code> .
<b>Systems</b>	<code>lexChainEq</code> in <b>Choco</b> , <code>lex_chain</code> in <b>SICStus</b> .
<b>See also</b>	<b>common keyword:</b> <code>lex_chain_greater</code> , <code>lex_chain_greatereq</code> , <code>lex_chain_less</code> , <code>lex_chain_lesseq</code> , <code>lex_greater</code> , <code>lex_greatereq</code> , <code>lex_less</code> ( <i>lexicographic order</i> ). <b>part of system of constraints:</b> <code>lex_lesseq</code> .
<b>Keywords</b>	<b>characteristic of a constraint:</b> <code>vector</code> , <code>automaton</code> , <code>automaton without counters</code> , <code>reified automaton constraint</code> . <b>constraint network structure:</b> <code>Berge-acyclic constraint network</code> . <b>constraint type:</b> <code>order constraint</code> , <code>system of constraints</code> . <b>filtering:</b> <code>arc-consistency</code> . <b>symmetry:</b> <code>symmetry</code> , <code>lexicographic order</code> .

**Automaton**

Figure 5.495 depicts the automaton associated with the `lex_between` constraint. Let  $L_i$ ,  $V_i$  and  $U_i$  respectively be the `var` attributes of the  $i^{th}$  items of the `LOWER_BOUND`, the `VECTOR` and the `UPPER_BOUND` collections. To each triple  $(L_i, V_i, U_i)$  corresponds a signature variable  $S_i$  as well as the following signature constraint:

$$\begin{aligned}
 (L_i < V_i) \wedge (V_i < U_i) &\Leftrightarrow S_i = 0 \wedge \\
 (L_i < V_i) \wedge (V_i = U_i) &\Leftrightarrow S_i = 1 \wedge \\
 (L_i < V_i) \wedge (V_i > U_i) &\Leftrightarrow S_i = 2 \wedge \\
 (L_i = V_i) \wedge (V_i < U_i) &\Leftrightarrow S_i = 3 \wedge \\
 (L_i = V_i) \wedge (V_i = U_i) &\Leftrightarrow S_i = 4 \wedge \\
 (L_i = V_i) \wedge (V_i > U_i) &\Leftrightarrow S_i = 5 \wedge \\
 (L_i > V_i) \wedge (V_i < U_i) &\Leftrightarrow S_i = 6 \wedge \\
 (L_i > V_i) \wedge (V_i = U_i) &\Leftrightarrow S_i = 7 \wedge \\
 (L_i > V_i) \wedge (V_i > U_i) &\Leftrightarrow S_i = 8.
 \end{aligned}$$

Figure 5.495: Automaton of the `lex_between` constraint

Figure 5.496: Hypergraph of the reformulation corresponding to the automaton of the `lex_between` constraint (since all states of the automaton are accepting there is no restriction on the last variable  $Q_n$ )
