

5.353 sliding_time_window

	DESCRIPTION	LINKS	GRAPH
Origin	N. Beldiceanu		
Constraint	<code>sliding_time_window(WINDOW_SIZE, LIMIT, TASKS)</code>		
Arguments	WINDOW_SIZE : <code>int</code> LIMIT : <code>int</code> TASKS : <code>collection(origin=dvar, duration=dvar)</code>		
Restrictions	WINDOW_SIZE > 0 LIMIT ≥ 0 <code>required(TASKS, [origin, duration])</code> TASKS.duration ≥ 0		
Purpose	For any time window of size WINDOW_SIZE, the intersection of all the tasks of the collection TASKS with this time window is less than or equal to a given limit LIMIT.		
Example	$\left(9, 6, \left\langle \begin{array}{ll} \text{origin} - 10 & \text{duration} - 3, \\ \text{origin} - 5 & \text{duration} - 1, \\ \text{origin} - 6 & \text{duration} - 2, \\ \text{origin} - 14 & \text{duration} - 2, \\ \text{origin} - 2 & \text{duration} - 2 \end{array} \right\rangle \right)$		
	The lower part of Figure 5.707 indicates the different tasks on the time axis. Each task is drawn as a rectangle with its corresponding identifier in the middle. Finally the upper part of Figure 5.707 shows the different time windows and the respective contribution of the tasks in these time windows. Note that we only need to focus on those time windows starting at the start of one of the tasks. A line with two arrows depicts each time window. The two arrows indicate the start and the end of the time window. At the left of each time window we give its occupation. Since this occupation is always less than or equal to the limit 6, the <code>sliding_time_window</code> constraint holds.		
Typical	WINDOW_SIZE > 1 LIMIT > 0 LIMIT < <code>sum</code> (TASKS.duration) TASKS > 1 TASKS.duration > 0		
Symmetries	<ul style="list-style-type: none"> • WINDOW_SIZE can be <code>decreased</code>. • LIMIT can be <code>increased</code>. • Items of TASKS are <code>permutable</code>. • One and the same constant can be <code>added</code> to the <code>origin</code> attribute of all items of TASKS. • TASKS.duration can be <code>decreased</code> to any value ≥ 0.

Contractible wrt. TASKS.

Usage

The `sliding_time_window` constraint is useful for timetabling problems in order to put an upper limit on the total work over sliding time windows.

Reformulation

The `sliding_time_window` constraint can be expressed in term of a set of $|\text{TASKS}|^2$ reified constraints and of $|\text{TASKS}|$ [linear inequalities](#) constraints:

- For each pair of tasks $\text{TASKS}[i], \text{TASKS}[j]$ ($i, j \in [1, |\text{TASKS}|]$) of the **TASKS** collection we create a variable Inter_{ij} which is set to the intersection of $\text{TASKS}[j]$ with the time window \mathcal{W}_i of size `WINDOW_SIZE` that starts at instant $\text{TASKS}[i].\text{origin}$:
 - If $i = j$ (i.e., $\text{TASKS}[i]$ and $\text{TASKS}[j]$ coincide):
 - $\text{Inter}_{ij} = \min(\text{TASKS}[i].\text{duration}, \text{WINDOW_SIZE})$.
 - If $i \neq j$ and $\text{TASKS}[j].\text{origin} + \text{TASKS}[j].\text{duration} < \text{TASKS}[i].\text{origin}$ (i.e., $\text{TASKS}[j]$ for sure ends before the time window \mathcal{W}_i):
 - $\text{Inter}_{ij} = 0$.
 - If $i \neq j$ and $\text{TASKS}[j].\text{origin} > \text{TASKS}[i].\text{origin} + \text{WINDOW_SIZE} - 1$ (i.e., $\text{TASKS}[j]$ for sure starts after the time window \mathcal{W}_i):
 - $\text{Inter}_{ij} = 0$.
 - Otherwise (i.e., $\text{TASKS}[j]$ can potentially overlap the time window \mathcal{W}_i):

$$- Inter_{ij} = \max(0, \min(\text{TASKS}[i].\text{origin} + \text{WINDOW_SIZE}, \text{TASKS}[j].\text{origin} + \text{TASKS}[j].\text{duration}) - \max(\text{TASKS}[i].\text{origin}, \text{TASKS}[j].\text{origin})).$$

2. For each task $\text{TASKS}[i]$ ($i \in [1, |\text{TASKS}|]$) we create a linear inequality constraint $Inter_{i1} + Inter_{i2} + \dots + Inter_{i|\text{TASKS}|} \leq \text{LIMIT}$.

See also

common keyword: `shift` (*temporal constraint*).

related: `sliding_time_window_sum` (sum of intersections of tasks with sliding time window replaced by sum of the points of intersecting tasks with sliding time window).

used in graph description: `sliding_time_window_from_start`.

Keywords

constraint type: sliding sequence constraint, temporal constraint.

Arc input(s)	TASKS
Arc generator	<code>CLIQUE</code> \mapsto <code>collection</code> (tasks1, tasks2)
Arc arity	2
Arc constraint(s)	<ul style="list-style-type: none">• tasks1.origin \leq tasks2.origin• tasks2.origin - tasks1.origin < WINDOW_SIZE
Sets	SUCC \mapsto [source, tasks]
Constraint(s) on sets	<code>sliding_time_window_from_start</code> $\left(\begin{array}{l} \text{WINDOW_SIZE,} \\ \text{LIMIT,} \\ \text{tasks,} \\ \text{source.origin} \end{array} \right)$

Graph model

We generate an arc from a task t_1 to a task t_2 if task t_2 does not start before task t_1 and if task t_2 intersects the time window that starts at the origin of task t_1 . Each set generated by SUCC corresponds to all tasks that intersect in time the time window that starts at the origin of a given task.

Parts (A) and (B) of Figure 5.708 respectively show the initial and final graph associated with the **Example** slot. In the final graph, the successors of a given task t correspond to the set of tasks that do not start before task t and intersect the time window that starts at the origin of task t .
