

5.279 no_peak

	DESCRIPTION	LINKS	AUTOMATON
Origin	Derived from peak .		
Constraint	no_peak(VARIABLES)		
Argument	VARIABLES : collection (var-dvar)		
Restrictions	$ VARIABLES > 0$ required (VARIABLES, var)		
Purpose	A variable V_k ($1 < k < m$) of the sequence of variables $VARIABLES = V_1, \dots, V_m$ is a <i>peak</i> if and only if there exists an i ($1 < i \leq k$) such that $V_{i-1} < V_i$ and $V_i = V_{i+1} = \dots = V_k$ and $V_k > V_{k+1}$. The total number of peaks of the sequence of variables $VARIABLES$ is equal to 0.		

Example $((1, 1, 4, 8, 8))$

The `no_peak` constraint holds since the sequence 1 1 4 8 8 does not contain any peak.

Figure 5.599: Illustration of the **Example** slot: a sequence of five variables V_1, V_2, V_3, V_4, V_5 respectively fixed to values 1, 1, 4, 8, 8 without any peak

Typical	$ VARIABLES > 3$ range (VARIABLES.var) > 1
---------	----------------------------------------------------------------

Symmetries

- Items of VARIABLES can be reversed.
- One and the same constant can be added to the var attribute of all items of VARIABLES.

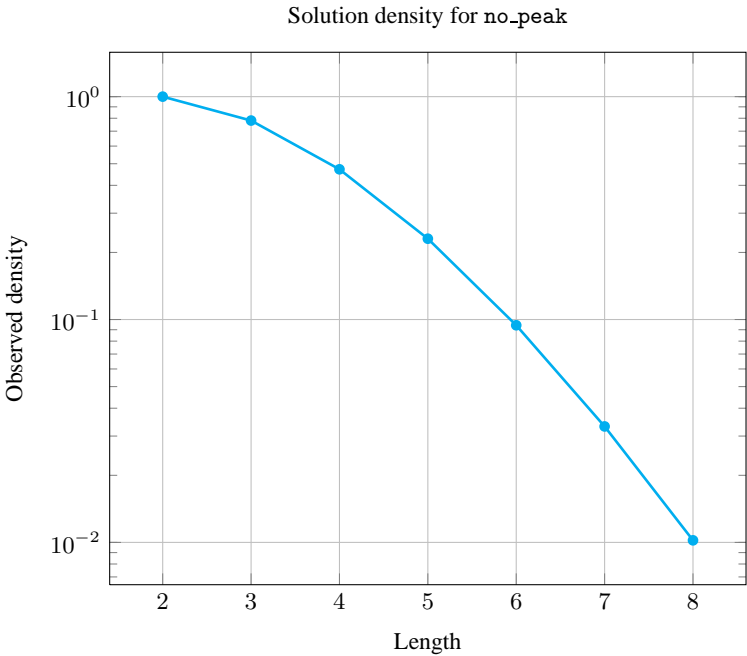

Arg. properties

Contractible wrt. VARIABLES.

Counting

Length (<i>n</i>)	2	3	4	5	6	7	8
Solutions	9	50	295	1792	11088	69498	439791

Number of solutions for no_peak: domains 0..*n*

**See also**

comparison swapped: `no_valley`.

generalisation: `peak` (introduce a variable counting the number of peaks).

implied by: `decreasing`, `increasing`.

implies: `all_equal_peak_max`.

related: `valley`.

Keywords

characteristic of a constraint: `automaton`, `automaton without counters`, `automaton with same input symbol`, `reified automaton constraint`.

combinatorial object: `sequence`.

constraint network structure: `sliding cyclic(1)` `constraint network(1)`.

Automaton

Figure 5.600 depicts the automaton associated with the `no_peak` constraint. To each pair of consecutive variables (VAR_i, VAR_{i+1}) of the collection `VARIABLES` corresponds a signature variable S_i . The following signature constraint links VAR_i , VAR_{i+1} and S_i : $(VAR_i < VAR_{i+1} \Leftrightarrow S_i = 0) \wedge (VAR_i = VAR_{i+1} \Leftrightarrow S_i = 1) \wedge (VAR_i > VAR_{i+1} \Leftrightarrow S_i = 2)$.

STATES SEMANTICS

s	: stationary/decreasing mode	$(\{> =\}^*)$
t	: increasing mode	$(< \{< =\}^*)$

Figure 5.600: Automaton of the `no_peak` constraintFigure 5.601: Hypergraph of the reformulation corresponding to the automaton of the `no_peak` constraint (since all states of the automaton are accepting there is no restriction on the last variable Q_{n-1})
