5.373 stable_compatibility

index - 1

DESCRIPTION LINKS GRAPH Origin P. Flener, [43] Constraint stable_compatibility(NODES) index-int, father-dvar, Argument collection prec-sint, Restrictions required(NODES, [index, father, prec, inc]) ${\tt NODES.index} \geq 1$ NODES.index < |NODES|distinct(NODES, index) ${\tt NODES.father} > 1$ NODES.father < |NODES| $\mathtt{NODES.prec} > 1$ $\mathtt{NODES.prec} < |\mathtt{NODES}|$ ${\tt NODES.inc} \geq 1$ $\mathtt{NODES.inc} \leq |\mathtt{NODES}|$ ${\tt NODES.inc} > {\tt NODES.index}$

Purpose

Enforce the construction of a *stably compatible* supertree that is compatible with several given trees. The notion of stable compatibility and its context are detailed in the **Usage** slot.

father -4 prec $-\{11, 12\}$

```
index - 2 father - 3 prec - \{8, 9\}
                                                      inc - \emptyset.
index - 3 father - 4 prec - \{2, 10\}
                                                      inc - \emptyset,
index - 4 father - 5 prec - \{1, 3\}
                                                      inc - \emptyset,
\mathtt{index} - 5 \qquad \mathtt{father} - 7 \quad \mathtt{prec} - \{4, 13\}
                                                      inc - \emptyset,
index - 6 father -2 prec -\{8, 14\}
                                                      inc - \emptyset,
index - 7
               father -7 prec -\{6,13\}
                                                      inc - \emptyset.
index - 8 father - 6 prec - \emptyset
                                                     inc - \{9, 10, 11, 12, 13, 14\}
\mathtt{index}-9
                father - 2 \quad prec - \emptyset
                                                      inc - \{10, 11, 12, 13\},\
index - 10 father - 3 prec - \emptyset
                                                      inc - \{11, 12, 13\},\
                                                      inc - \{12, 13\},\
index - 11 father -1
                                prec - \emptyset
index - 12
                father-1
                                prec - \emptyset
                                                      inc - \{13\},
index - 13
               \mathtt{father}-5
                                prec - \emptyset
                                                      inc - \{14\}
index - 14 father - 6 prec - \emptyset
                                                      \mathtt{inc} - \emptyset
```

 $\mathtt{inc} - \emptyset$.

Example

Figure 5.720 shows the two trees we want to merge. Note that the leaves a and f occur in both trees.

The left part of Figure 5.721 gives one way to merge the two previous trees. This solution corresponds to the ground instance provided by the example. Note that there exist 7 other ways to merge these two trees. They are respectively depicted by Figures 5.721 to 5.724.

Usage

One objective of phylogeny is to construct the genealogy of the species, called the *tree of life*, whose leaves represent the contemporary species and whose internal nodes represent extinct species that are not necessarily named. An important problem in phylogeny is the construction of a supertree [76] that is compatible with several given trees. There are several definitions of tree compatibility in the literature:

- A tree \mathcal{T} is *strongly compatible* with a tree \mathcal{T}' if \mathcal{T}' is topologically equivalent to a subtree \mathcal{T} that respects the node labelling. [294]
- A tree \mathcal{T} is *weakly compatible* with a tree \mathcal{T}' if \mathcal{T}' can be obtained from \mathcal{T} by a series of arc contractions. [398]
- A tree \mathcal{T} is *stably compatible* with a set \mathcal{S} of trees if \mathcal{T} is weakly compatible with each tree in \mathcal{S} and each internal node of \mathcal{T} can be labelled by at least one corresponding internal node of some tree in \mathcal{S} .

For the supertree problem, strong and weak compatibility coincide if and only if all the given trees are binary [294]. The existence of solutions is not lost when restricting weak compatibility to stable compatibility.

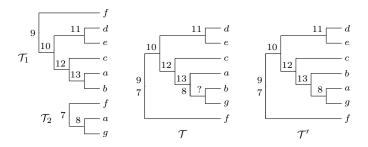

Figure 5.725: Supertree problem instance and two of its solutions

For example, the trees \mathcal{T}_1 and \mathcal{T}_2 of Figure 5.725 have \mathcal{T} and \mathcal{T}' as supertrees under both weak and strong compatibility. As shown, all the internal nodes of \mathcal{T}' can be labelled by corresponding internal nodes of the two given trees, but this is not the case for the father of b and g in \mathcal{T} . Hence \mathcal{T} and four other such supertrees are debatable because they speculate about the existence of extinct species that were not in any of the given trees. Consider also the three small trees in Figure 5.726: \mathcal{T}_3 and \mathcal{T}_4 have \mathcal{T}_4 as a supertree under weak compatibility, as it suffices to contract the arc (3,2) to get \mathcal{T}_3 from \mathcal{T}_4 . However, \mathcal{T}_3 and

20070601 2201

Figure 5.726: Three small phylogenetic trees

 \mathcal{T}_4 have no supertree under strong compatibility, as the most recent common ancestor of b and c, denoted by mrca(b,c), is the same as mrca(a,b) in \mathcal{T}_3 , namely 1, but not the same in \mathcal{T}_4 , as mrca(b,c)=3 is an evolutionary descendant of mrca(a,b)=2. Also, \mathcal{T}_4 and \mathcal{T}_5 have neither weakly nor strongly compatible supertrees.

Under strong compatibility, a first supertree algorithm was given in [4], with an application for database management systems; it takes $O(l^2)$ time, where l is the number of leaves in the given trees. Derived algorithms have emerged from phylogeny, for instance *One-Tree* [294]. The first constraint program was proposed in [191], using standard, non-global constraints. Under weak compatibility, a phylogenetic supertree algorithm can be found in [398] for instance. Under stable compatibility, the algorithm from computational linguistics of [79] has supertree construction as special case.

See also root concept: tree.

Keywords application area: bioinformatics, phylogeny.

constraint type: graph constraint.

final graph structure: tree.

Arc input(s)	NODES
Arc generator	$CLIQUE \mapsto \texttt{collection}(\texttt{nodes1}, \texttt{nodes2})$
Arc arity	2
Arc constraint(s)	${\tt nodes1.father} = {\tt nodes2.index}$
Graph property(ies)	 MAX_NSCC≤ 1 NCC= 1 MAX_ID≤ 2 PATH_FROM_TO(index, index, prec) = 1 PATH_FROM_TO(index, index, inc) = 0 PATH_FROM_TO(index, inc, index) = 0

Graph model

To each distinct leave (i.e., each species) of the trees to merge corresponds a vertex of the initial graph. To each internal vertex of the trees to merge corresponds also a vertex of the initial graph. Each vertex of the initial graph has the following attributes:

- An index corresponding to a unique identifier.
- A father corresponding to the father of the vertex in the final tree. Since the leaves
 of the trees to merge must remain leaves we remove the index value of all the leaves
 from all the father variables.
- A set of precedence constraints corresponding to all the arcs of the trees to merge.
- A set of incomparability constraints corresponding to the incomparable vertices of each tree to merge.

The arc constraint describes the fact that we link a vertex to its father variable. Finally we use the following six graph properties on our final graph:

- The first graph property MAX_NSCC ≤ 1 enforces the fact that the size of the largest strongly connected component does not exceed one. This avoid having circuits containing more than one vertex. In fact the root of the merged tree is a strongly connected component with a single vertex.
- The second graph property NCC = 1 imposes having only a single tree.
- The third graph property **PATH_FROM_TO**(index, index, prec) = 1 enforces for each vertex *i* a set of precedence constraints; for each vertex *j* of the precedence set there is a path from *i* to *j* in the final graph.
- The fourth graph property MAX_ID ≤ 2 enforces that the number of predecessors (i.e., arcs from a vertex to itself are not counted) of each vertex does not exceed 2 (i.e., the final graph is a binary tree).
- The fifth and sixth graph properties PATH_FROM_TO(index, index, inc) =
 0 and PATH_FROM_TO(index, inc, index) = 0 enforces for each vertex i a
 set of incomparability constraints; for each vertex j of the incomparability set there
 is neither a path from i to j, nor a path from j to i.

Figures 5.727 and 5.728 respectively show the precedence and the incomparability graphs associated with the **Example** slot. As it contains too many arcs the initial graph is not shown. Figures 5.721 shows the first solution satisfying all the precedence and incomparability constraints.
